EMC and System-ESD Design Guidelines for Board Layout
The topic of ElectroMagnetic Compatibility (EMC) is important for the functionality and security of electronic devices. Today ' s designers have to deal with permanently increasing system frequencies, changing power limits, high density layouts by more complex systems, and the need to keep manufacturing costs low.

An EMC/EMI system-design and testing methodology for FPD-Link III SerDes. Introduction. Automotive electromagnetic compatibility (EMC) tests are broadly classified into two areas: 1) Radiated emissions tests that analyze the electromagnetic interference (EMI) or noise generated by the system as an “ aggressor ” , and 2) System electrostatic-discharge (ESD) and bulk-current injection (BCI) tests that measure the “ immunity ” of the system as a “ victim ” to ambient emissions.

Students completing the course will be able to make good decisions regarding board layout and system design for EMC. They will also be introduced to tools and techniques for quickly reviewing designs in order to flag potential problems well before the first hardware is built and tested. LearnEMC - Electronic Systems Design for EMC Compliance
Electromagnetic compatibility(EMC) is the ability of electrical equipment and systems to function acceptably in their electromagnetic environment, by limiting the unintentional generation, propagation and reception of electromagnetic energy which may cause unwanted effects such as electromagnetic interference(EMI) or even physical damage in operational equipment.

Electromagnetic Compatibility(EMC) and Electrostatic Discharge(ESD) immunity must be considered in the early design phase of a system. This is also true for the application of liquid crystal displays and the accompanying drivers. If ignored, problems encountered later during testing or in the field will become very difficult and expensive to fix, whereas in the early development stage, measures to improve EMC and ESD immunity can be implemented at low cost or often even for free.

EMC techniques in electronic design Part 6 - ESD ...

The first part of system-level design for ESD is to prevent entry of the ESD discharge inside the enclosure. It ' s best, but not always possible, to prevent an ESD event from occurring in the first place. This should be an easy task to accomplish if your product is contained in a non-metallic/plastic enclosure.
