Genetics Study Guide

Genetics is the study of how genes bring about characteristics, or traits, in living things and how those characteristics are inherited. Genes are specific sequences of nucleotides that code for particular proteins. Through the processes of meiosis and sexual reproduction, genes are transmitted from one generation to the next.

Flashcards | Quizlet

Genetics is the study of inheritance or heredity. Genetics helps to explain how traits are passed from parents to their young. Parents pass traits to their young through gene transmission. Genes are located on chromosomes and consist of DNA. They contain specific instructions for protein synthesis.

Genetics Study Guide Vocab Flashcards | Quizlet

Cells use a chemical code called deoxyribonucleic acid or DNA. DNA carries all of the cell's instructions. DNA is located in the nucleus. During cell division, it wraps around proteins to form chromosomes. DNA is passed from parents to offspring.

DNA's Discovery

In 1953, James Watson and Francis Crick discovered the structure of DNA. The work of Rosalind Franklin led to Watson and Crick's discovery. Franklin said DNA is made up of two spirals.

Genetics Study Guide

Molecular genetics, or molecular biology, is the study of the biochemical mechanisms of inheritance. It is the study of the biochemical nature of the genetic material and its control of phenotype. It is the study of the connection between genotype and phenotype. The connection is a chemical one. Control of phenotype is one of the two roles of DNA
