The concept of auto-enrolment was introduced in the Pensions Act 2008. The first employees were auto-enrolled in October 2012. If an employee has fixed protection and they are auto-enrolled then they will have to opt out within the one month opt out period or else they will lose fixed protection. With effect from April 2015 the Department for Work and Pensions introduced technical changes to auto-enrolment legislation listing four new exceptions that modify some of

Crop Protection To succeed in getting the best and the maximum yield from his farm, a farmer has to minimise his crop loss and it demands proper and sustainable agricultural practices. By employing the right agricultural practices he can aim to improve the yield of the crops.

Crop Protection. Wheat diseases. The wheat crop is host to a wide range of fungal pathogens. In the UK those which are most important to the crop are Septoria tritici, yellow rust, mildew, brown rust, Septoria nodorum, eyespot, fusarium ear-blight and take-all. Most of these infect the leaves and reduce the photosynthetic area and may induce other physiological changes that affect both yield and quality.

Cover crops slow erosion, improve soil, smother weeds, enhance nutrient and moisture availability, help control many pests and bring a host of other benefits to your farm. At the same time, they can reduce costs, increase profits and even create new sources of income. You'll reap dividends on your cover crop investments for years, since their benefits accumulate over the long term. This book will help you find which ones are right for you. Captures farmer and other research results from the

past ten years. The authors verified the info. from the 2nd ed., added new results and updated farmer profiles and research data, and added 2 chap. Includes maps and charts, detailed narratives about individual cover crop species, and chap. about aspects of cover cropping.

The book offers a rich toolkit of relevant, adoptable ecosystem-based practices that can help the world's 500 million smallholder farm families achieve higher productivity, profitability and resource-use efficiency while enhancing natural capital.

Published since 1947, OMAFRA's Guide to Weed Control has been the definitive resource for the summary of herbicide options to control weeds in agricultural crops. The 2018 edition has been split into two versions, as was common place during the 1950's. This is the field crops version (Pub 75A) while a horticulture crop version (Pub 75B) can also be purchased.

management, harvest, and storage of the field crops produced in Ontario. Chapter 1 outlines basic crop scouting procedures and the proper initiation of on-farm trials. Chapter 2 discusses various aspects of soil management & fertilizer uses that are common to all field crops in Ontario. The remainder of the guide focusses on each field crop commodity separately, covering such matters as tillage, variety selection, planting, fertility, harvesting, storage, weed control, insect & disease information, and crop problems specific to each commodity. A final chapter focusses on proper grain storage and the control of stored grain insect pests.

This book is devoted to Agroecological Crop Protection, which is the declension of the principles of agroecology to crop protection. It presents the concepts of this innovative approach, case studies and lessons and generic keys for agroecological transition. The book is intended for a wide audience, including scientists, experimenters, teachers, farmers, students. It represents a new tool, proposing concrete keys of action on the basis of feedbacks validated scientifically. Beyond the examples presented, it is therefore of general scope and proposes recommendations for all temperate and tropical cropping systems. It contributes to the

training and teaching modules in this field and it is an updated information support for professionals and a teaching aid for students (agronomy, crop protection, biodiversity management, agroecology).

The global biodiversity and climate emergencies demand transformative changes to human activities. For example, food production relies on synthetic, industrial and non-sustainable products for managing pests, weeds and diseases of crops. Sustainable farming requires approaches to managing these agricultural constraints that are more environmentally benign and work with rather than against nature. Increasing pressure on

synthetic products has reinvigorated efforts to identify alternative pest management options, including plant-based solutions that are environmentally benign and can be tailored to different farmers' needs, from commercial to small holder and subsistence farming. Botanical insecticides and pesticidal plants can offer a novel, effective and more sustainable alternative to synthetic products for controlling pests, diseases and weeds. This Special Issue reviews and reports the latest developments in plant-based pesticides from identification of bioactive plant chemicals, mechanisms of activity and validation of their use in horticulture and disease vector

control. Other work reports applications in rice weeds, combination biopesticides and how chemistry varies spatially and influences the effectiveness of botanicals in different locations. Three reviews assess wider questions around the potential of plant-based pest management to address the global challenges of new, invasive and established crop pests and as-yet underexploited pesticidal plants.

Continued population growth, rapidly changing consumption patterns and the impacts of climate change and environmental degradation are driving limited resources of food, energy, water and materials

towards critical thresholds worldwide. These pressures are likely to be substantial across Africa, where countries will have to find innovative ways to boost crop and livestock production to avoid becoming more reliant on imports and food aid. Sustainable agricultural intensification - producing more output from the same area of land while reducing the negative environmental impacts - represents a solution for millions of African farmers. This volume presents the lessons learned from 40 sustainable agricultural intensification programmes in 20 countries across Africa, commissioned as part of the UK Government's Foresight project. Through detailed case studies, the authors

of each chapter examine how to develop productive and sustainable agricultural systems and how to scale up these systems to reach many more millions of people in the future. Themes covered include crop improvements, agroforestry and soil conservation, conservation agriculture, integrated pest management, horticulture, livestock and fodder crops, aquaculture, and novel policies and partnerships.

Pesticides-including herbicides, insecticides, and fungicides-have contributed to substantial increases in crop yields over the past five decades. Properly applied, pesticides contribute to higher yields and improved

product quality by controlling weeds, insects, nematodes, and plant pathogens. In addition, herbicides reduce the amount of labor, machinery, and fuel used for mechanical weed control. However, because pesticides may possess toxic properties, their use often prompts concern about human health and environmental consequences. The examination of pesticide use trends is critical for informed pesticide policy debate and science-based decisions. This report analyzes pesticide use trends using a new pesticide database compiled from USDA and proprietary data, focusing on 21 crops.
