The third and final fast-paced installment in the popular *Raised by Wolves* series, called "the most compelling YA werewolf series out there" by New York Times best-selling author Melissa Marr. A rogue Were is killing humans, and Cedar Ridge is the center of the crisis. Bryn, human alpha of the Cedar Ridge pack, must meet with the Senate to deal with the problem. Though the subject is the rogue wolf, Bryn knows the other packs want what she has. Her territory. Her females. Her pack. They want her death. She could never survive a battle with another alpha, so she'll have to keep her wits about her as she navigates the fine line between helping the Senate and hurting her chances at keeping her lands, protecting her pack, and surviving.

The booming computer games and animated movie industries continue to drive the graphics community's seemingly insatiable search for increased realism, believability, and speed. To achieve the quality expected by audiences of today's games and movies, programmers need to understand and implement physics-based animation. To provide this understanding, this book is written to teach students and practitioners and theory behind the mathematical models and techniques required for physics-based animation. It does not teach the basic principles of animation, but rather how to transform theoretical techniques into practical skills. It details how the mathematical models are derived from physical and mathematical principles, and explains how these mathematical models are solved in an efficient, robust, and stable manner with a computer. This impressive and comprehensive volume covers all the issues involved in physics-based animation, including collision detection, geometry, mechanics, differential equations, matrices, quaternions, and more. There is excellent coverage of collision detection algorithms and a detailed overview of a physics system. In addition, numerous examples are provided along with detailed pseudo code for most of the algorithms. This book is ideal for students of animation, researchers in the field, and professionals working in the games and movie industries. Topics Covered: * The Kinematics: Articulated Figures, Forward and Inverse Kinematics, Motion Interpolation * Multibody Animation: Particle Systems, Continuum Models with Finite Differences, the Finite Element Method, Computational Fluid Dynamics * Collision Detection: Broad and Narrow Phase Collision Detection, Contact Determination, Bounding Volume Hierarchies, Feature-and Volume-Based Algorithms

A host of award-winning female novelists, academics and actresses come together to celebrate the phenomenon that is *Doctor Who*, discuss their rather inventive involvement with the show's fandom, and examine why they adore this series so much.
